- Inorganic Chemistry:

It is the branch chemistry which deals with study of inorganic compounds.

- Inorganic compounds means the compounds other than plant or animal & other than carbon ~~comp~~ containing compounds.

- Mechanism -

It is step wise description of reaction.

Inorganic chemistry includes acid-base reaction, displacement, redox reaction etc.  
It mainly deals with salt & crystal.

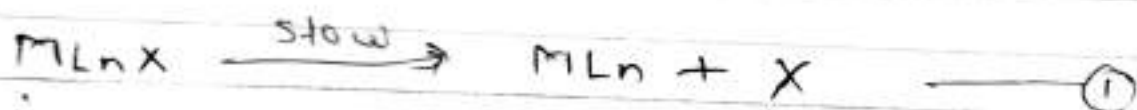

Inorganic reaction mechanism classified into three major classes

- ① Dissociative mechanism
- ② Associative
- ③ Interchange

Mechanism — stepwise description of reaction

### ① Dissociative Mechanism —

Dissociative mechanism formation of an intermediate having the reduced coordination no. of central metal by a breaking a bond is important.

There are two steps in this mechanism

- ① step complete  $ML_nX$  dissociate to give  $ML_n$  &  $X$  product. This is slow reaction. & this is rate determining step. Here dissociative step is slow & rate determine it called dissociative mechanism.

Rate of reaction depends on  $[ML_nX]$   
this reaction is  $SN^1$  reaction.

- Octahedral complexes consist 6 ligand which surrounded by surrounding of central metal atom.

There are three types.

- 1) Acid hydrolysis
- 2) Base hydrolysis
- 3) Anation

① Acid hydrolysis - Replacement of one ligand of where the req<sup>n</sup> is commonly known as aquation (acid hydrolysis).
